[Space x 1 line]

[Abstract Text: Arial, 12 pt, left, justified text]

*(i) **The Abstract** should not exceed **250 words**. Abstract text should be divided into the following sections: Objectives (a brief statement of the purpose of the investigation along with the the working hypothesis)- Materials and Methods (A brief description of the materials and experimental method used); Results (state the results simply and clearly so that significant facts can be readily identified, where appropriate, statistics should be clearly stated); Conclusions (a brief summary of the essential results you believe were demonstrated by the experimental data and the impact of the results).*

Abstract should be in a form comprehensible to any scientist and suitable for publication without the full article text.

The abstract should be intelligible to the non-specialist as well as the specialist in your field, and hence should avoid specialized terms and abbreviations.

*(ii) **Key words.** Provide 3-5 key words identifying the nature of the subject matter alphabetically in the last part of the summary. It should be written single-spaced in a single paragraph.*

The abstract MUST incorporate a minimum of one figure or table to illustrate the key findings

Tissue engineering has emerged as a promising interdisciplinary strategy to restore tissue function by integrating principles of biomaterials, cell biology, and regenerative medicine. **Objectives:** This study aimed to evaluate the potential of a tissue-engineered …… **Methods**: A tissue-engineered scaffold was fabricated and characterised …… **Results:** The engineered construct demonstrated favourable structural properties ……. **Conclusions**: These findings suggest that the proposed tissue-engineered approach holds significant potential for application in ……

Keywords: Regenerative, Scaffold, Tissue engineering, Wound healing
